

PATIENT NAME: Snuggles Meyers
SPECIMEN ID #: 700004
SPECIES: Feline
GENDER: Female Spayed
AGE: 13.0
WEIGHT: 10.2 lb

MRN: 1075241
DRAW DATE: 28-Mar-22
RECEIVED DATE: 6-Jun-22
REPORT DATE: 17-Jun-22
SAMPLE TYPE: Fur

VETERINARIAN: Not Provided
FACILITY: VDI Animal Hospital
 123 Main Street
 Small Town, CA 55555
PH: 805-555-5555
FAX: 805-555-5556

Fur/hair is the only matrix suitable for studying a long period of exposure to pollutants. The pollutants circulating in the blood are automatically captured by the web of the fur when it grows and stays intact. Blood analysis is useful, but contrary to fur/hair analysis, blood is a snapshot and not the culmination of weeks of exposure.

Test	Range	Flag	Previous	Results	Notable Change	Comments
				PPM		
Ca	700-3000			1754.51		Patient values outside of the normal ranges for nutritional minerals may be the result of inadequate diet, environmental exposure, poor metabolism, or other conditions. Evaluate patient and retest in 2 months after correcting for any irregularities. Refer to Mineral Supplementation page for guidance.
Co	0.02-0.5			0.03		
Cr	0.6-5	low		0.16		
Cu	8-25	low		6.09		
Fe	25-400			60.38		
K	200-1400			360.86		
Mg	100-450			292.87		
Mn	1-10			1.83		
Na	700-10000			1931.27		
P	220-500			291.95		
Se	0.4-2.5			1.38		
Si	20-600			58.58		
Sr	0-4.5	high		4.58		
V	0-1.2			0.08		
Zn	150-300	low		91.46		
Ag	0-2			0.00		Patient values are all within the normal limits indicating no historical or ongoing issues with environmental minerals. Retest if major diet or health change occurs, or animal's environment substantially changes.

Ba	0-5			0.00		
Be	0-1			0.00		
Li	0-0.5			0.24		
Mo	0-3			0.00		
Ni	0-10			0.10		
Sn	0-5			0.21		
As	0-1			0.04		Patient has no significant elevation of toxic metals
Cd	0-0.7			0.01		
Hg	0-0.2			0.02		
Pb	0-10			0.20		

Reference intervals should be considered as guidelines for comparison with reported test values. These reference ranges were established from a large population of "healthy" animals. They should not be considered as absolute limits for determining deficiency, toxicity or acceptance until fully validated element-specific studies are completed.

PATIENT NAME: Snuggles Meyers

MRN: 1075241

VETERINARIAN: Dr. Max Smith

The following minerals have been identified as being outside of the reference interval.

For a description of all minerals, visit our website at: www.vdilab.com

Symbol	Name	Description
Cr	Chromium	Chromium is an essential dietary mineral. It can be found from the consumption of products such as yeast, wheat, apples and green pepper. A deficiency of chromium can cause insulin resistance and diabetes, however elevated Chromium may be toxic especially if found in fur- indicating long term exposure.
Cu	Copper	Copper in fur suggests environmental exposure or consumption of items such as pennies, copper wiring, jewelry or other copper containing metals. Excessive amounts of copper over time may become toxic and may damage the liver if left untreated or source of copper is not removed.
Sr	Strontium	Early studies have shown that dogs who eat high levels of sardines or sardine oil supplements have high levels of strontium. Strontium acts in the same way that calcium does in the body and deposits within the bone.
Zn	Zinc	Zinc is an essential mineral found in red meats, whole grains, and other animal products. Excess zinc found in fur may be due to the consumption of items such as bolts, pennies, jewelry, nasal sprays, and many other household items that contain zinc.

Essential nutrients, those that are obtained by ingestion, are very important to health. Ensuring your pet is receiving enough can be as simple as supplementing their current diet to improve mineral content. Below is patient-specific dosing guidelines to help your pet obtain the proper minerals that may have been low as indicated in this fur analysis.

Mineral Supplement Guidelines, prepared specifically for Snuggles Meyers

Feline Minerals, Rx Vitamins for Pets

Feline Minerals provides macro- and micro-mineral supplementation, specifically calcium for cats to help balance home-prepared meals and as a general mineral supplement when required.

Feline Minerals is intended to provide:

- Calcium
- Magnesium
- Iron
- Strontium
- Sodium
- Manganese
- Phosphorus
- Potassium
- Chromium

DAILY DOSE

1 scoop
Split among meals

This dose is a total dose for the day. Do not give more than recommended.

Supplementing with Feline Minerals:

- Supplementation listed above is a total daily dose and should be split among meals to avoid any GI discomfort. If your cat is showing signs of discomfort, excessive thirst, panting, or other abnormal signs, stop use of the product and consult a veterinarian.
- The dosage of the individual minerals is very important. Seemingly small variations in mineral content in a diet can have significant impact on animal health. Any time dietary changes are made, it's important to watch for changes in health and behavior, and retest any labwork to ensure proper balance is achieved.
- This product contains calcium and magnesium, both of which are tightly regulated in the body. If your cat's recent blood work shows abnormal calcium or magnesium levels, consult your veterinarian before starting Canine Minerals. Conversely, if your cat is experiencing issues with this supplement, blood work may be warranted to check blood levels.

For more information, contact VDI Laboratory (805-577-6742) or Rx Vitamins (800-792-2222)

The Mineral Formula:

The Canine Minerals Formula was designed to be used primarily as a mineral-rich dietary supplement to balance home-prepared meals for dogs. It can also be used as a general mineral supplement for those patients who would benefit from dietary mineral supplementation.

The Minerals Formula is a 100% natural multiple mineral and trace element product. It is mined from an exclusive source in the western United States, containing 9 macro- and micro- minerals for optimum health. This mineral deposit, which is totally unique in its makeup, is marine sedimentary in nature and estimated to have been formed during the Triassic-Jurassic periods of the Mesozoic Era, approximately 150 to 200 million years ago. It is one of the most complete sources of naturally-occurring essential minerals and trace elements available.
